Interface

Installation

The rotary encoder is connected by one, two or three cables. This depends on whether the power supply is integrated into the bus cable or connected separately. If the power supply is integrated into the bus cable, one of the cable glands can be fitted with a plug. Any unused cable outlets must be closed using a suitably certified - proof blind plug.

Profibus Output

The Profibus-DP device address is set by user-friendly rotary switches in the connection cap. Allowed addresses are between 1 and 125. Each can only be used once.

The connection cap can easily be opened by removing the six screws in the cap.

The Termination Resistor is integrated into the connection cap. It must be switched to the ON position if the encoder is connected at the physical end or beginning of the bus.

The power supply has to be connected once (no matter which clamps). If the encoder is not the last device on the bus the power supply can be forwarded to the next device through the corresponding additional clamps.

The GSD file is necessary for installing the encoder. The GSD file and the detailed user manual can be downloaded from our homepage: www.scancon.dk

Incremental Output

The Incremental output consists of two channel (A, B) quadrature with an index channel (Z) as well as complementary (A-, B-, Z-) outputs.

The Incremental output terminal block is found on the encoder body cover, is **removeable** and with **push-in spring connection method**. This can be accessed once the connection cap has been removed.
